

PaperFlow sample - Functions

Course: MATH 006A

Topic: Functions

Date: 2026-09-29

A function assigns exactly one output to each input.

Domain: the set of permitted inputs.

Range: the set of outputs produced by a function.

Example: $f(x) = 2x + 3$, so $f(4) = 11$.

For $g(x) = 1 / (x - 2)$, the domain excludes $x = 2$.

Review: distinguish the domain from the range.
